Android sdk manager not found in eclipse

It looks like I have some problems after updating my android sdk tools and platform-tools using the SDK manager. The problem is that after the update, I found that the AVD or SDK options in the windows pop-up menu in eclipse are gone! And I can't find any option to create an android project from file->new projects any more. I tried to remove ADT from eclipse and software page from available software sites and then reinstall ADT from using help->install new software. The installation was successful, but I still have no option for shortcuts for manager SDK or AVD in eclipse, and neither can I create a new android project. By the way, android perspectives are not gone, they are still here. I can also manually open avd and sdk manager from the directory where I installed them. Can someone please show me the solution? Any help would be greatly appreciated. The Android SDK separates tools, platforms, and other components into packages that you can download using the SDK Manager. You can run the SDK Manager in one of the following ways: From eclipse (with ADT), select Window > Android SDK Manager. In Windows, double-click the file .exe .exe the root of the Android sdk.
